TEACHING

- Spring Semester, [EEP 118 Applied Econometrics](#) Formulation of a research hypothesis and definition of an empirical strategy. Regression analysis with cross-sectional, time-series, and panel data; econometric methods for the analysis of qualitative information; hypothesis testing. The techniques of statistical and econometric analysis are developed through applications to a set of case studies and real data in the fields of environmental, resource, and international development economics. Students learn the use of statistical software for economic data analysis.

- Spring Semester, ARE 242 Quantitative Policy Analysis. The first half covers the applied industrial organization and applied structural econometrics methods of quantitative policy analysis motivated by demand, production, and industrial organization theory. The second half covers reduced-form-quantitative methods motivated by production theory and applied to papers ranging in coverage from global agricultural supply to field-level supply. The applied portion of the class consists of lecture empirical analyses to be expanded in coding exercises in several problem sets. In the applied programming portion during lectures and in the problem sets, students are exposed to data analysis in R, Stata, and Matlab for model estimation and policy analyses. Towards the class grade, students are asked to write a discussion on a paper, write a blog, and replicate existing papers in the problem-set assignments.
